Reflection Paper

Making my own website was a really challenging experience. At first, I thought it would be easy, but as I started working on it, I realized how many things I needed to learn and do. Adding features like navigation bars, photo galleries, and different sections was not just about placing them on the page it needed careful coding and a lot of adjustments. Making it responsive was even harder because I had to make sure it looked good and worked properly on both a computer and a phone. Finishing the whole website took a lot of patience, trial and error, and going back to fix small mistakes. It wasn't easy, but seeing the final result made all the hard work worth it not perfect but it's all good.

Through this experience, I learned how important it is to give enough time to build a website properly. It's really not something you can finish in one sitting. It needs to be a step-by-step process. I started by sketching the layout on paper, planning every part carefully before even touching the computer. That sketch became my guide while coding, helping me stay organized and clear about what I needed to do next. Taking it slow, focusing on one step at a time, and managing my time properly made a huge difference in completing my website successfully
